Article: Feeding the world: farming and food (172 words)

Agriculture has changed dramatically in the last century. A modern farmer uses **irrigation** and a chemical **fertilizer** to increase the **yield** of every **crop**, and an effective **pesticide** protects plants from insects, although it can harm bees. Healthy **soil** is vital, and a **fertile** valley can support many farms. At harvest time, the **harvest** is moved to cities, and **livestock** farmers supply meat and milk.

Opinion is divided over new methods. Supporters of **genetically modified** seed argue that it can prevent **famine**, while many consumers prefer **organic** products that avoid chemicals. In poorer regions, **subsistence** farmers grow only enough to feed their own families, while **rural** communities lose young people to cities. Because **imported** goods travel far, the idea of reducing **food miles** has gained support.

Good **nutrition** depends on a varied diet rich in **nutrient** sources, and every national **cuisine** reflects its history and climate. Methods of **preservation**, such as drying and salting, have kept food safe for centuries. The task now is to **feed a growing population** without **using up** the land.

Useful phrases from the article

PHRASE	MEANING
feed a growing population	provide enough food for more people
using up	exhausting

The 20 new words

WORD		MEANING	EXAMPLE
agriculture	n	the science and practice of farming	*Agriculture employs half the population.*
