A Discovery by Accident

In 1928 a Scottish doctor, Alexander Fleming, came back from vacation and found a mess in his **laboratory**. A strange mold was growing on one of the dishes, and all the bacteria around it were dead.

The **discovery** was made by accident, but Fleming understood its importance. The mold was studied for many years, and later it was turned into a medicine: **penicillin**. It was first used to treat patients in the 1940s.

Since then, millions of lives have been saved, and many other antibiotics have been invented. Fleming won the Nobel Prize in 1945. His story shows that an important **breakthrough** can be made by a person who is simply curious.

WORD HELP

laboratory — лаборатория
penicillin — пенициллин
mold — плесень
discovery — открытие
breakthrough — прорыв
bacteria — бактерии

Read it aloud two times. Then close the page and tell your partner three things you remember.
