Nature's Rules

Nature has rules, and many of them are simple. If the sun heats the **ocean**, water **evaporates** and rises into the air. If the air is cold, the water turns into clouds, and if the clouds get heavy, it rains.

Plants use that rain. If they get enough water and light, they grow and produce **oxygen**. If they don't, they die, and the animals that live there lose their food. That is how an **ecosystem** works: everything is connected.

The problem is that people change the rules. If we burn a lot of **fossil fuels**, the **atmosphere** gets warmer. If the **atmosphere** gets warmer, the ice at the poles **melts**, and the sea level rises. Small actions can have big results.

WORD HELP

nature — природа
evaporate — испаряться
ecosystem — экосистема
atmosphere — атмосфера
pole — полюс
ocean — океан
oxygen — кислород
fossil fuels — ископаемое топливо
melt — таять
produce — производить

Read it aloud two times. Then close the page and tell your partner three things you remember.
